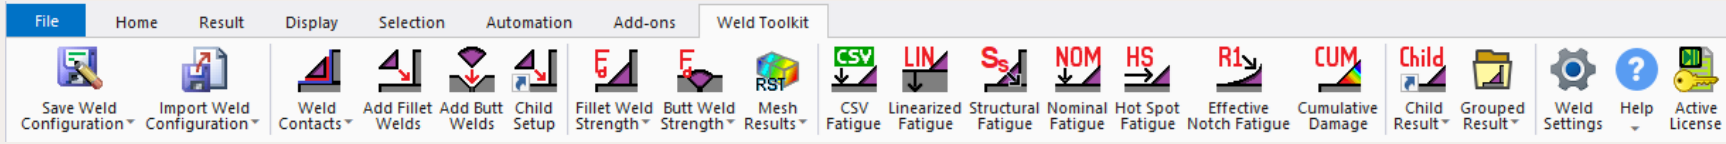
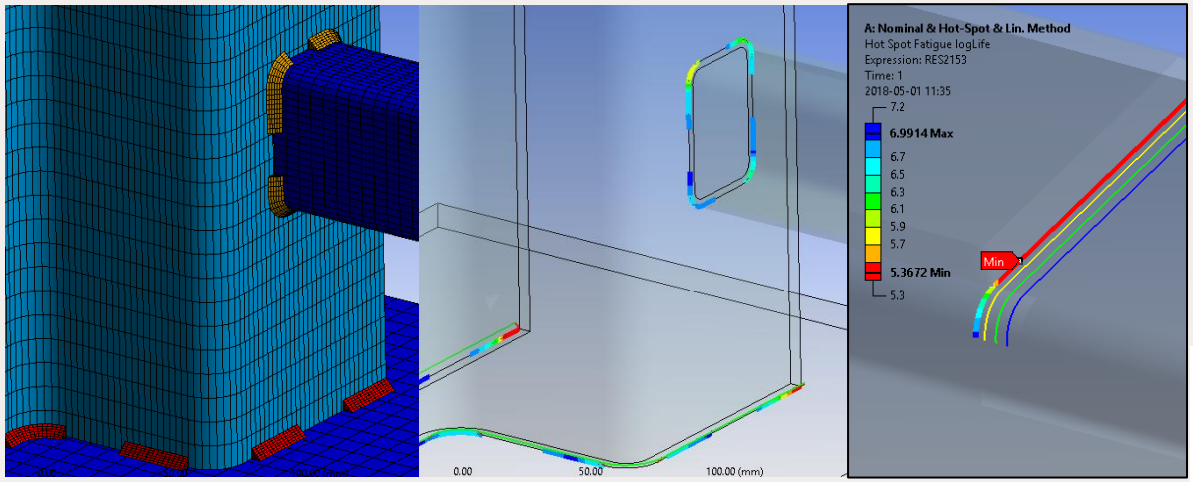
EDRMedeso Weld Toolkit

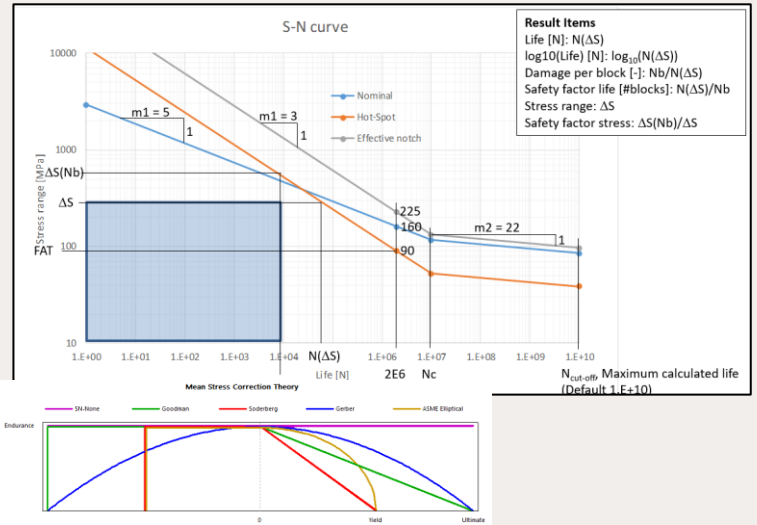
Ansys Mechanical 2025 R1

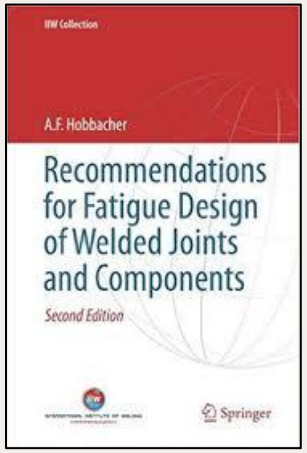
Weld Toolkit



- Main Features:
  - Automation and parametric solid weld creation without CAD in Mechanical.
  - Evaluate strength according to Eurocode 3, AWS D1.1/AISC 360-16 or user defined codes.
  - Evaluate fatigue according to Linearized Stress, Structural Stress, Nominal, Hot-Spot and Notch method.
  - Fatigue S-N curves from IIW, Eurocode 3, Eurocode 9, DNV or user defined S-N curves.
- Business Value:
  - Ansys unique automatic weld creation replaces manual CAD work, meshing & contact setup.
  - Ease of use in pre/post processing. Evaluation of hundreds of welds in minutes instead of days.
  - Visualize the strength utilization, calculated weld thickness or fatigue life direct on the model.
  - Automatic weld report for each selected analysis.







Save and Import Weld Configuration

- Welds and result objects can be reused between models and projects to speed up preparation and post processing. By using “Named Selections” the scooping is applied automatic.

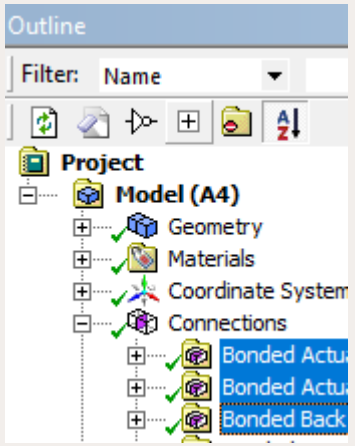
- Save Weld Configuration writes a text file in the current solution folder or “user_files”.
  All or selected fillet/butt weld and result objects form the current analysis are exported.
  The file can be used as a template for creating user defined weld configurations.

- Import Weld Configuration reads a weld configuration file and creates all weld objects in the file unless an object with the same name already exists.

- The Save/Import option can be used to copy the weld setup from one analysis to another.
  It can also be used if the weld configuration is defined outside of Mechanical or by another automation app/Wizard.

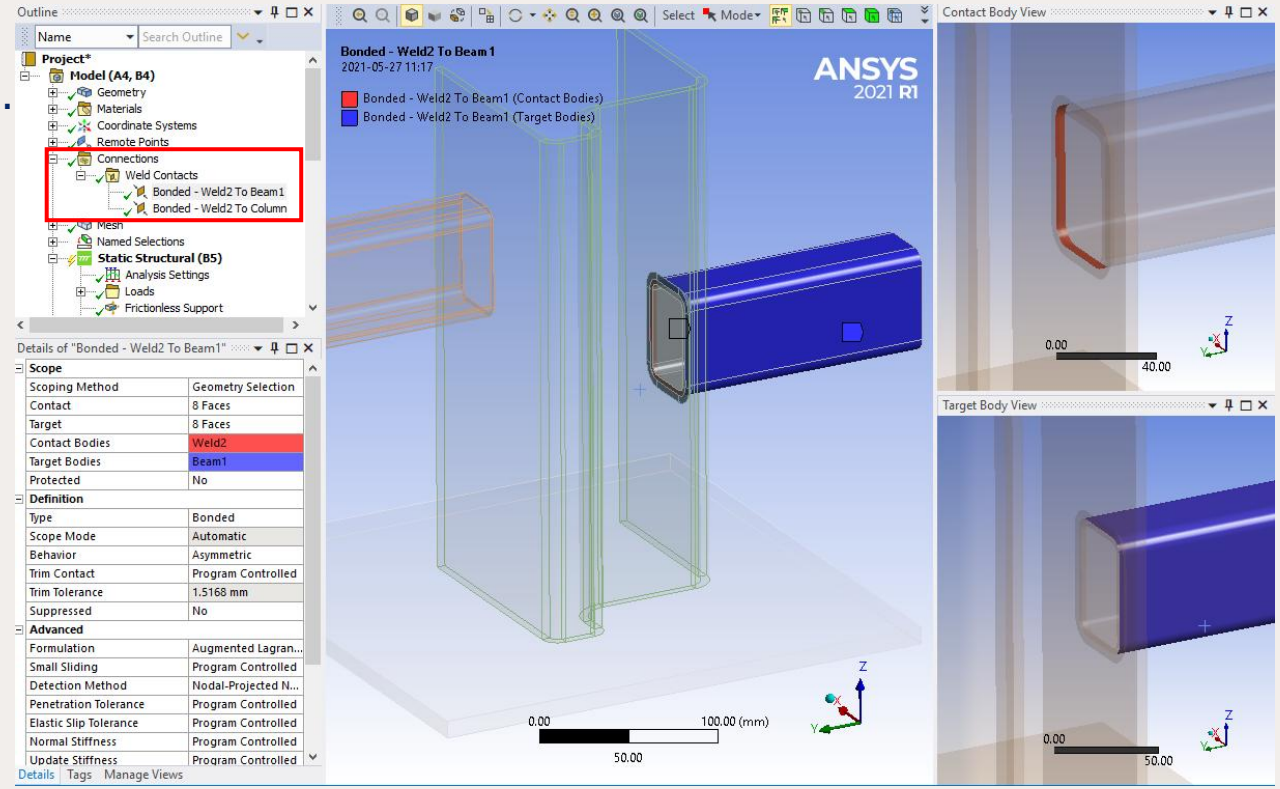
Optimize Bonded Contacts

- Bonded face to face contacts can be optimized for weld strength evaluation by setting the smaller face as “Contact” and the larger face as “Target” and change behavior to “Asymmetric”.
- Select the “Connections” folder, “Contacts” folders or individual “Contacts” and click the button “Optimize Bonded Contacts” to update all selected objects.
- An info message will show the number of selected contacts to optimize and how many that was updated.



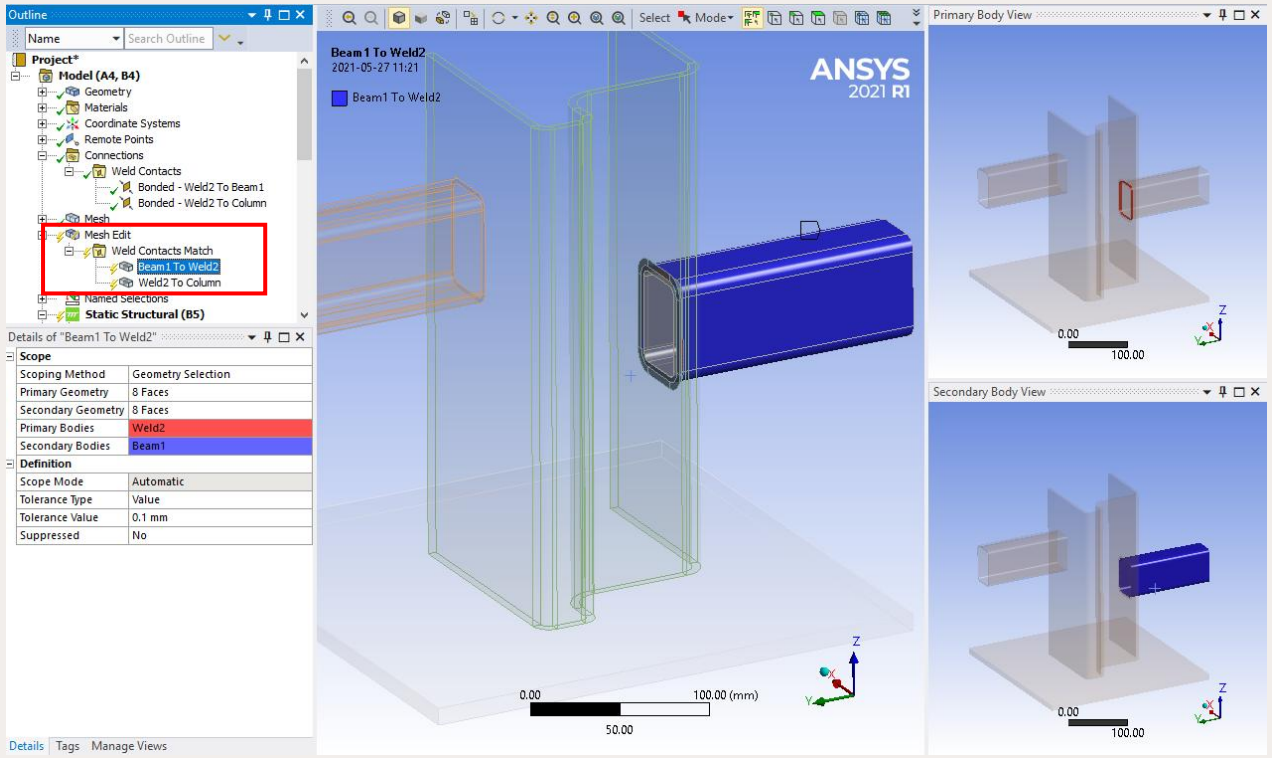
Create Weld Contacts

- Managing contacts for large assemblies with many welds is important to get consistent results.
- “Create Weld Contacts” will create a “Weld Contacts” Connection folder and create bonded contacts for all parts containing “weld” in the name.
- Delete any existing duplicate weld contacts in other contacts folders.
- The created contacts can be edited.
- Tip: Multi-select parts in Geometry group and press “F2” to rename.



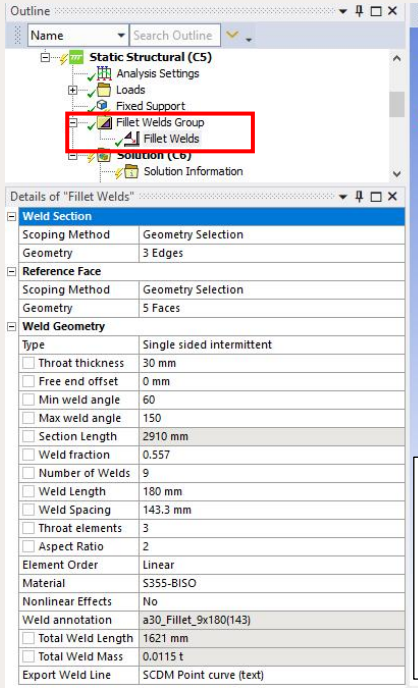
Weld Contacts Match

- For tetrahedron meshed parts the weld contact match can be used to create a “Weld Contacts Match” folder in “Mesh Edit” and create corresponding mesh imprint for the weld contacts.
- The mesh imprint will improve the contact calculation as the contact and target mesh will match.
- Note: If the parts belong to a multi-body part with option “imprint” this is not needed.

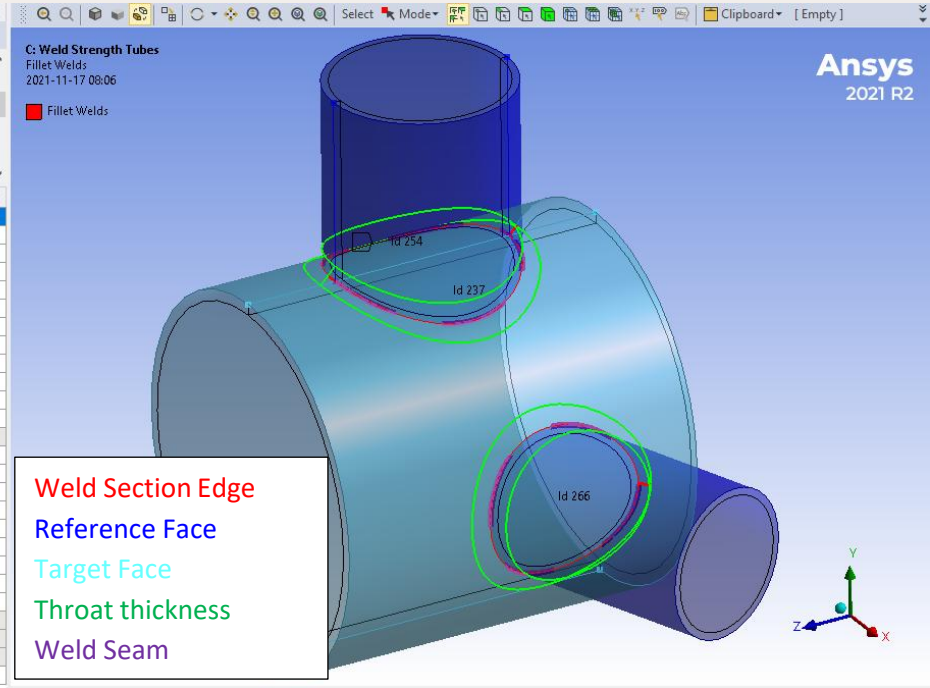


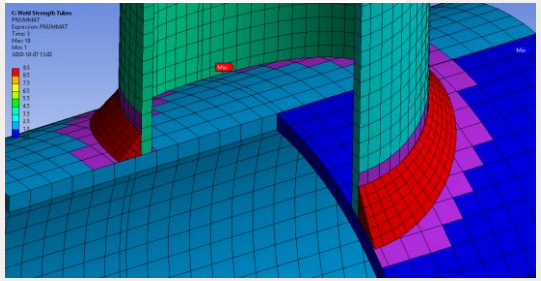
Add Fillet and Butt Weld

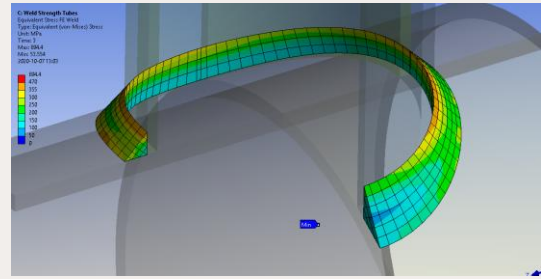
- The *Fillet* and *Butt weld* feature can model weld joints with solid elements to get best possible accuracy of the joint stiffness, also including intermittent weld.
- The weld geometry is parametric and is visualized with a green line at the weld throat section.
- To create welds, select a group of edges located at the weld root and the connected faces. Select material and throat thickness.
- The weld size and properties can be changed without needing to re-mesh or update the contacts in the model. The weld meshing and contact setup is fully automatic and done when solving.



Weld Section	
Scoping Method	Geometry Selection
Geometry	3 Edges
Reference Face	
Scoping Method	Geometry Selection
Geometry	5 Faces
Weld Geometry	
Type	Single sided intermittent
Throat thickness	30 mm
Free end offset	0 mm
Min weld angle	60
Max weld angle	150
Section Length	2910 mm
Weld fraction	0.557
Number of Welds	9
Weld Length	180 mm
Weld Spacing	143.3 mm
Throat elements	3
Aspect Ratio	2
Element Order	Linear
Material	S355-BISO
Nonlinear Effects	No
Weld annotation	a30_Fillet_9x180(143)
Total Weld Length	1621 mm
Total Weld Mass	0.0115 t
Export Weld Line	SCDM Point curve (text)

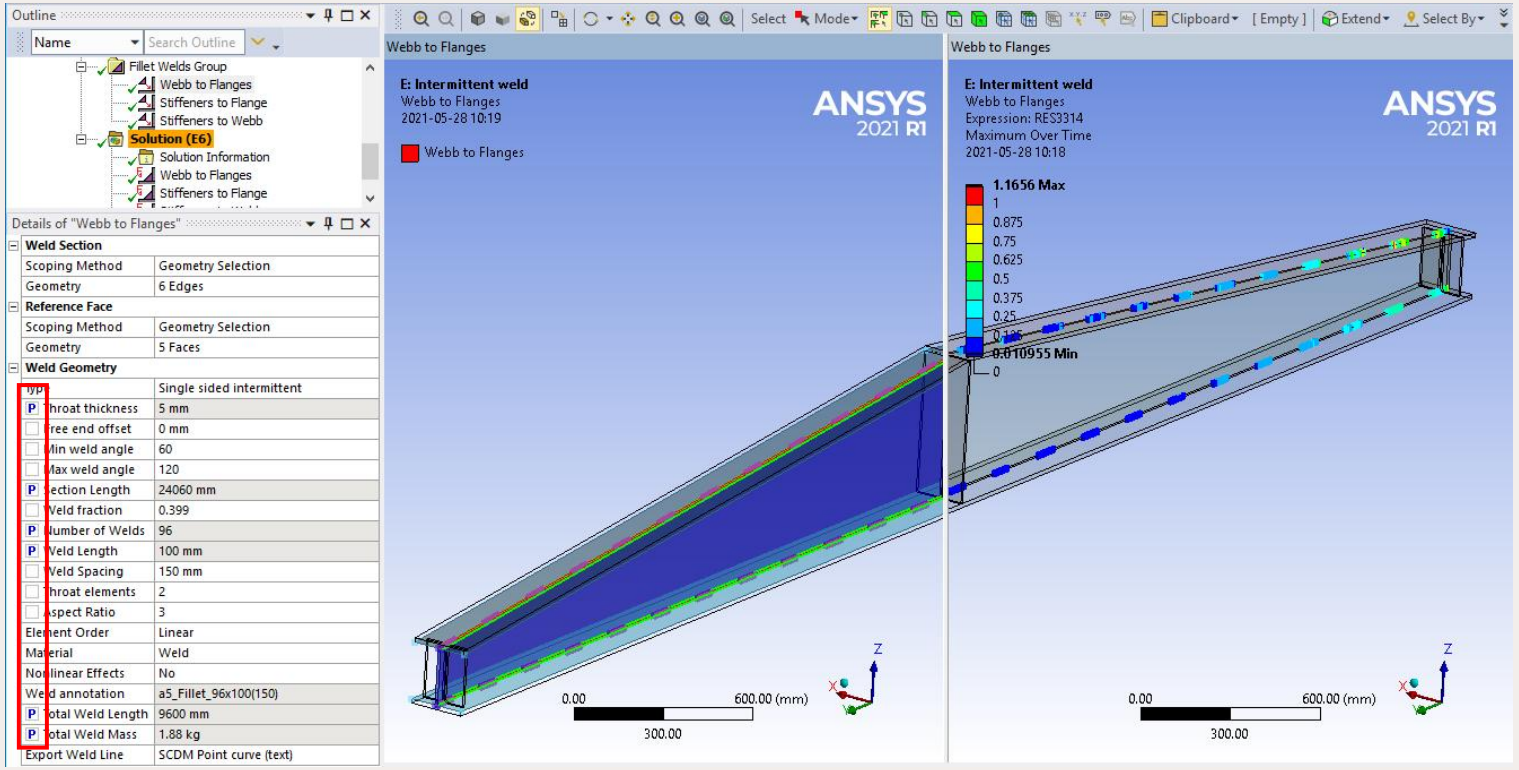






Intermittent Welds and Optimization

- Intermittent welds saves cost in production using less weld filler material and shorter welding time.
- The throat thickness, section length and spacing can be defined as parameters in a design point study to see the impact on weld mass, weld utilization, local deformation and stress.

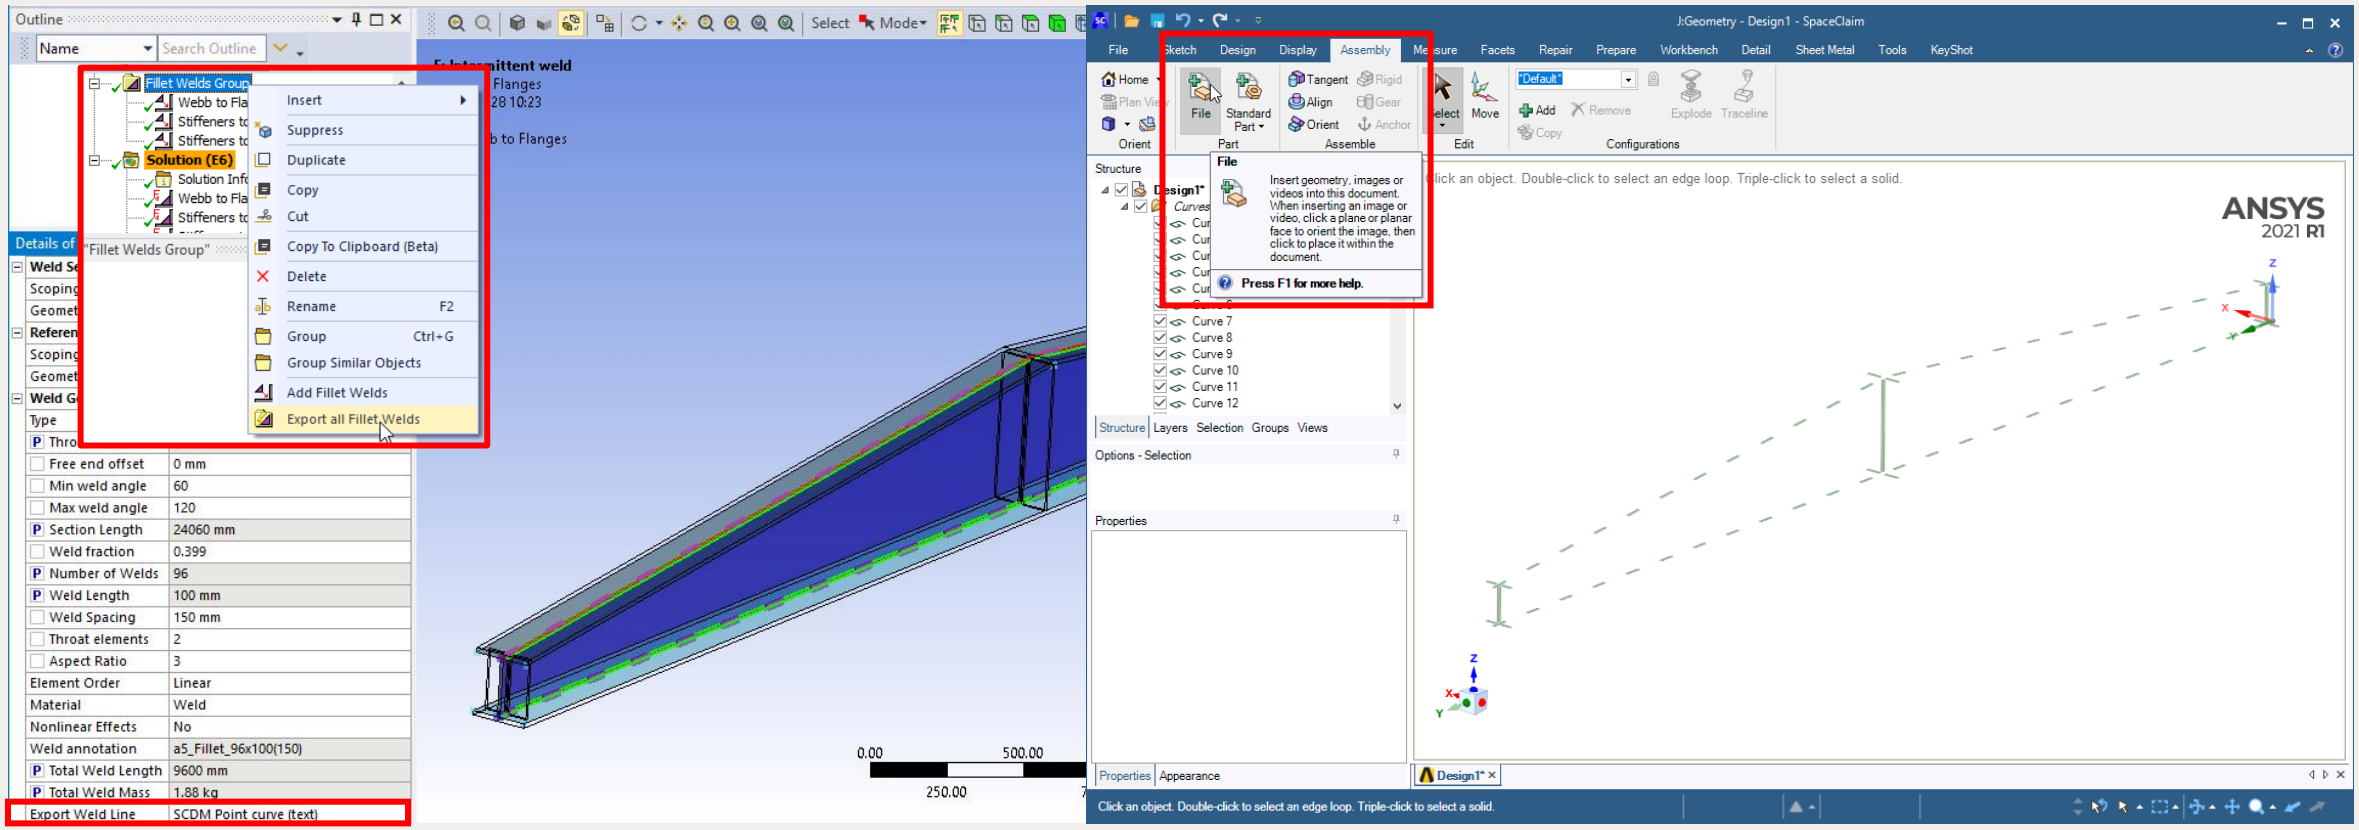


Outline of Schematic E8: Parameters

	A	B	C	D
1	ID	Parameter Name	Value	Unit
2	Input Parameters			
3	Intermittent weld (E1)			
4	P3	Webb to Flanges Number of Welds	96	
5	P4	Webb to Flanges Throat thickness	5	mm
6	P6	Webb to Flanges Weld Length	100	mm
*	New input parameter	New name	New expression	
8	Output Parameters			
9	Intermittent weld (E1)			
10	P1	Webb to Flanges Section Length	24060	mm
11	P2	Webb to Flanges Total Weld Length	9600	mm
12	P5	Webb to Flanges Total Weld Mass	1.88	kg
13	P7	Webb to Flanges Maximum	1.1656	
14	P8	Weld Fraction	0.399	
*	New output parameter		New expression	
16	Charts			

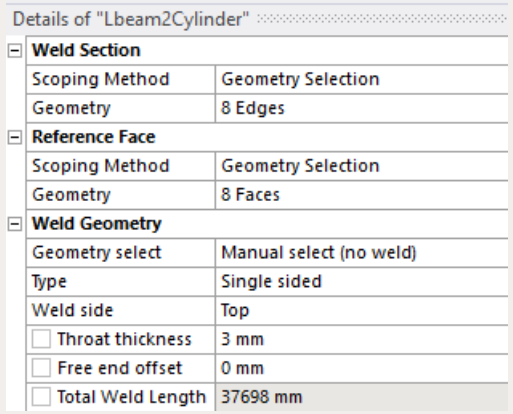
Weld line export

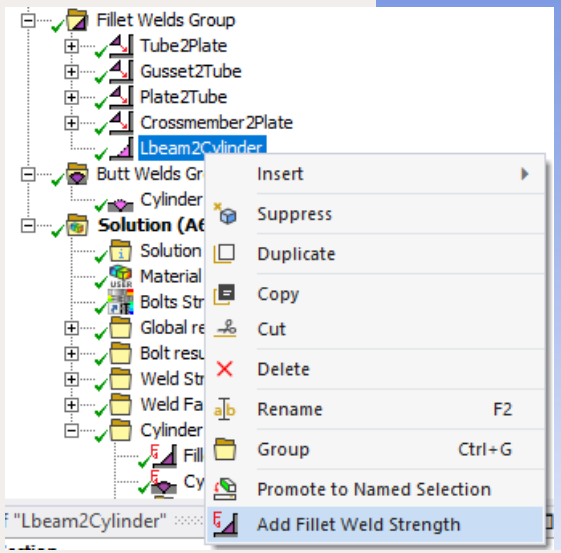
- The defined weld lines can be exported to Design Modeler or Space Claim line files.

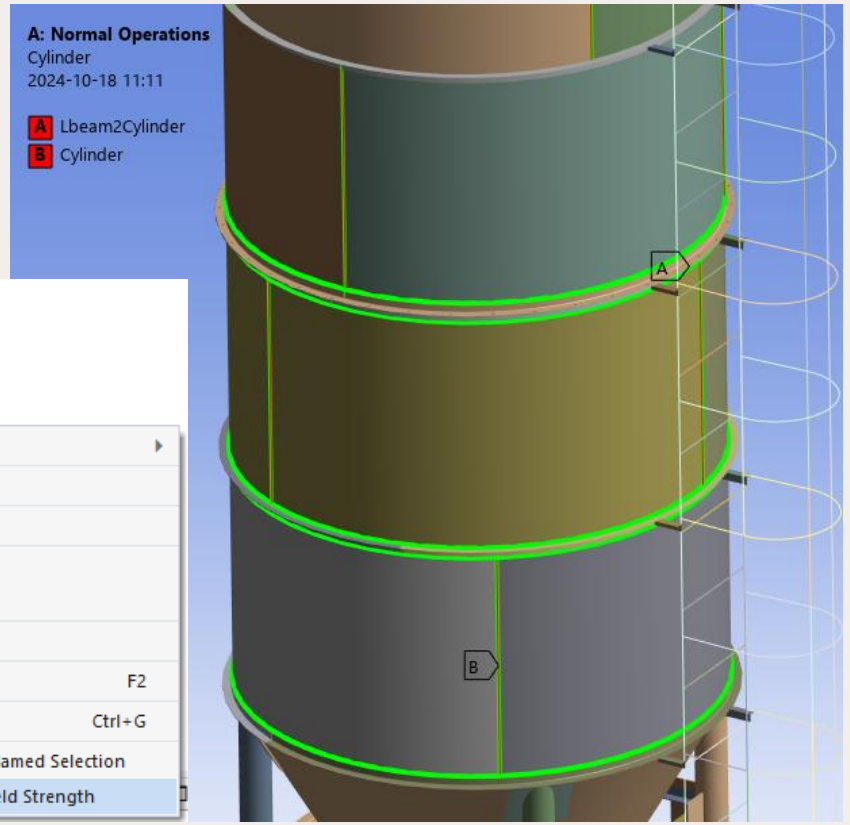


Virtual Fillet/Butt Welds

- Pre-define welds to simplify post processing and provide a visual representation of all welds in the model.
- Check that there is no double definitions of welds.
- Context actions to add Weld Strength results

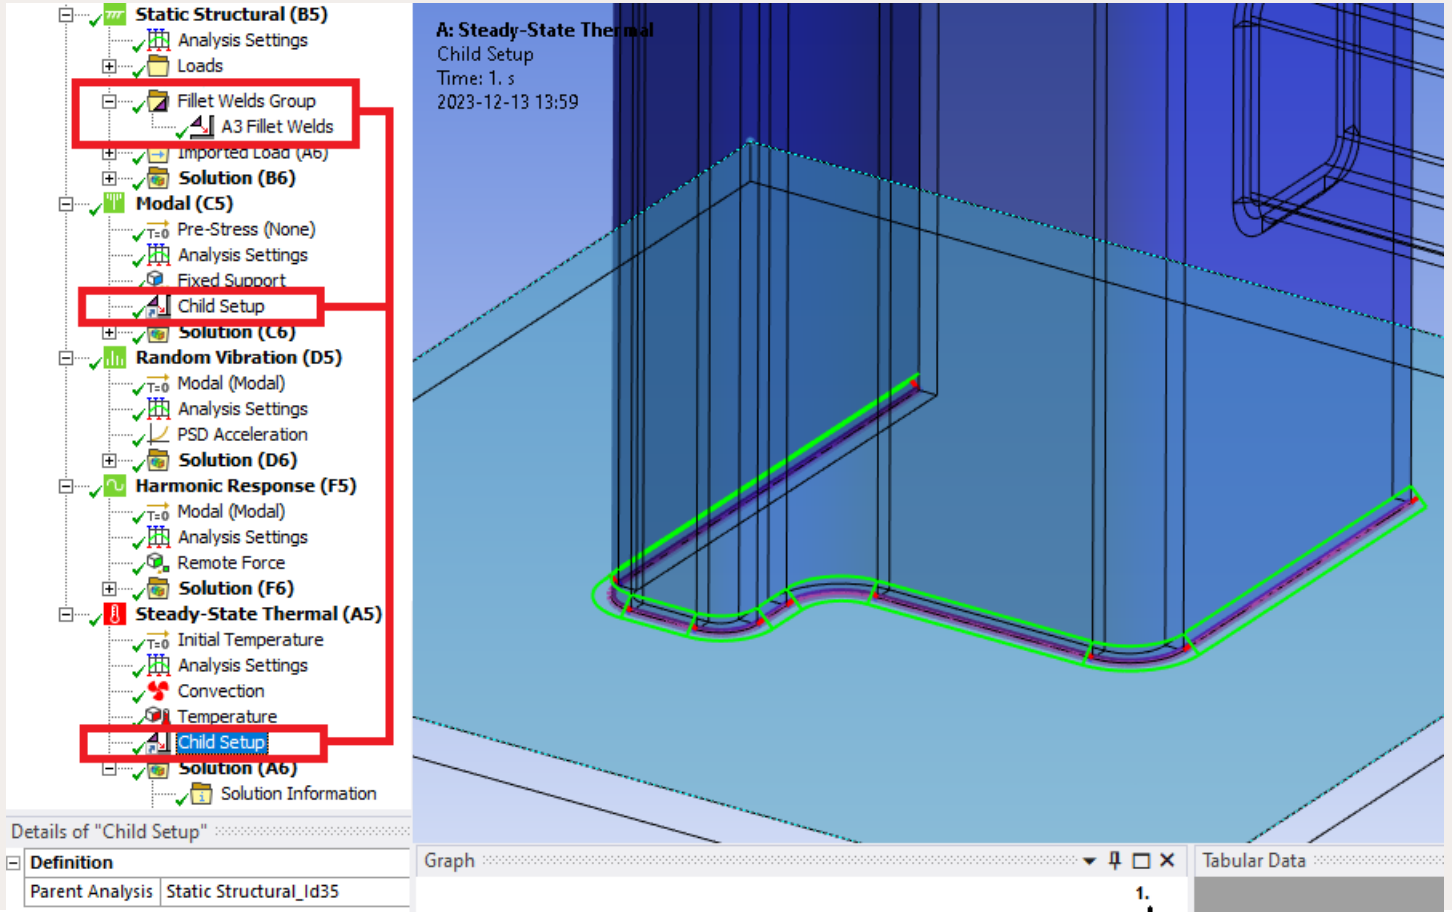






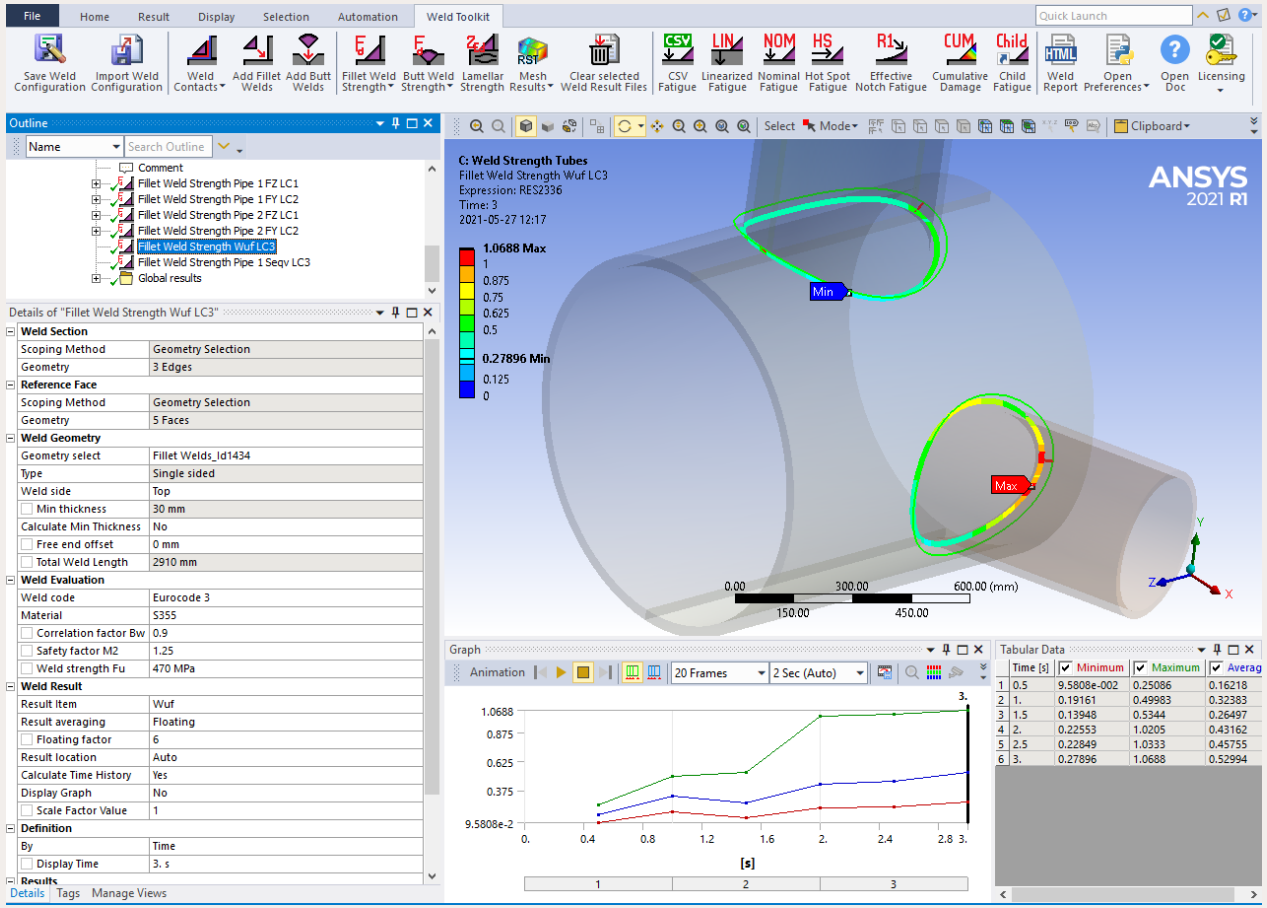
Child Setup

- The Child Setup let you re-use the Add Welds Group setup from one linked parent analysis.
- If updating the weld setup in the parent analysis the linked setup will automatically get the new data.



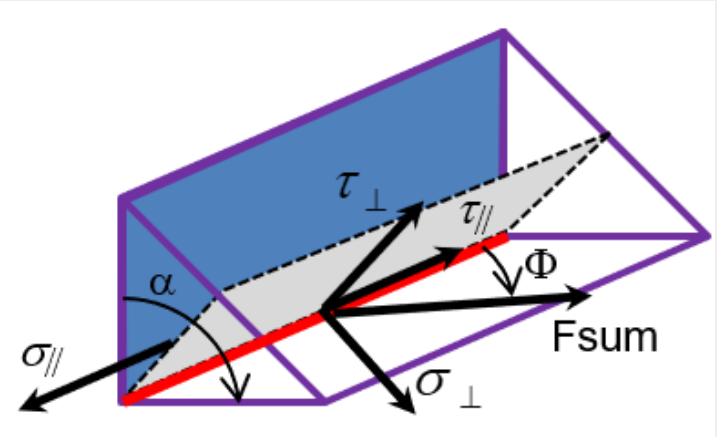
Weld Strength

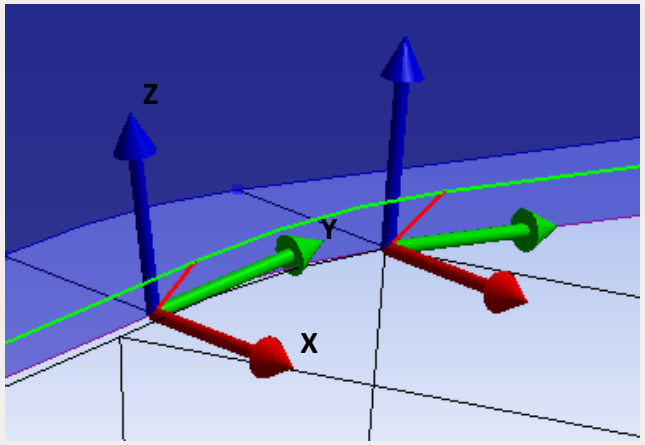
- *Weld Strength* results evaluate stresses and forces from each throat section in the selected group of welds.
- Weld utilization factor, W*uf*, can be post processed according to Eurocode 3 or AWS D1.1/AISC 360-16 or user defined codes.
- Results are plotted on the geometry and listed in csv files used by the “Weld Report” feature or external use in e.g. Excel.
- Standard Mechanical features “Calculate Time History” and “Maximum Over Time” can be used to see the worst case for all loads steps and all welds in one plot!

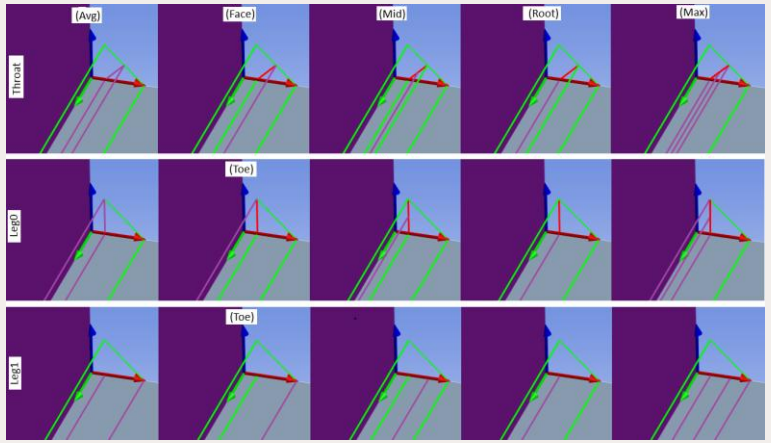


Weld Strength – Stress components

- The weld strength evaluation is based on the “directional method” where the structural component stresses in the weld section is derived from section forces. The method is therefore mesh size independent.
- The stresses are evaluated in a local coordinate system that follows the geometry.
- Results can be evaluated at different section angles, α, and in addition to the component stresses the force angle, Φ, between the weld line and the total force, *Fsum*, and local bending moment, *My*, around local weld axis Y is available to use in the evaluation.

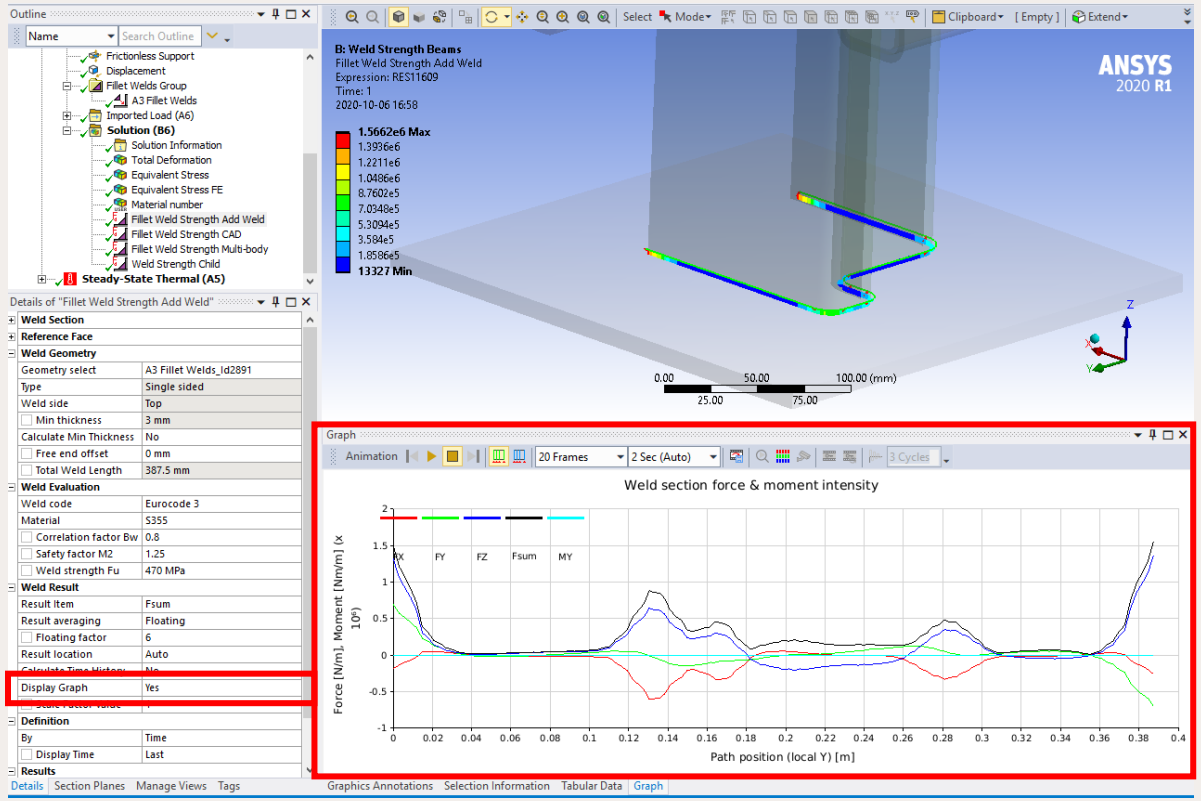


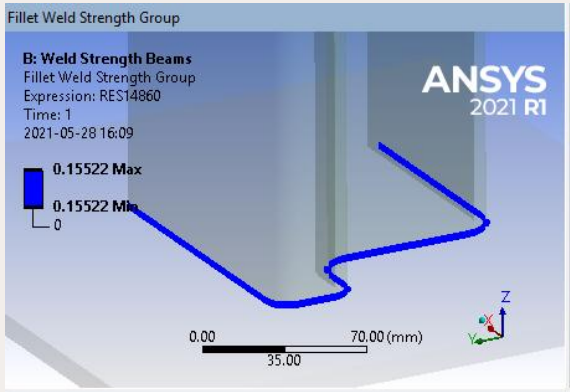


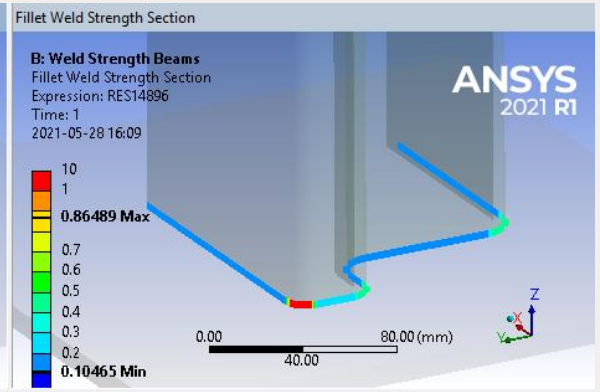


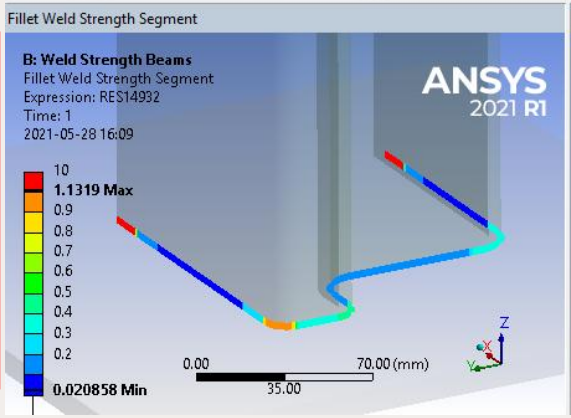
Weld Strength – Path & Average

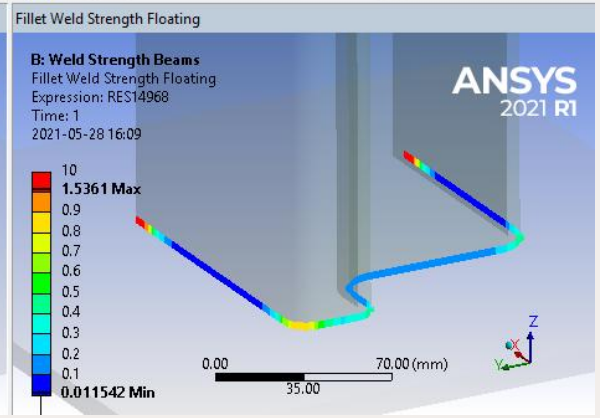
- A path plot of a single weld seam can be displayed in the Graph window.
- Results can be averaged in different ways, *Group, Section (Constant), Section (Linear), Segment, Floating*





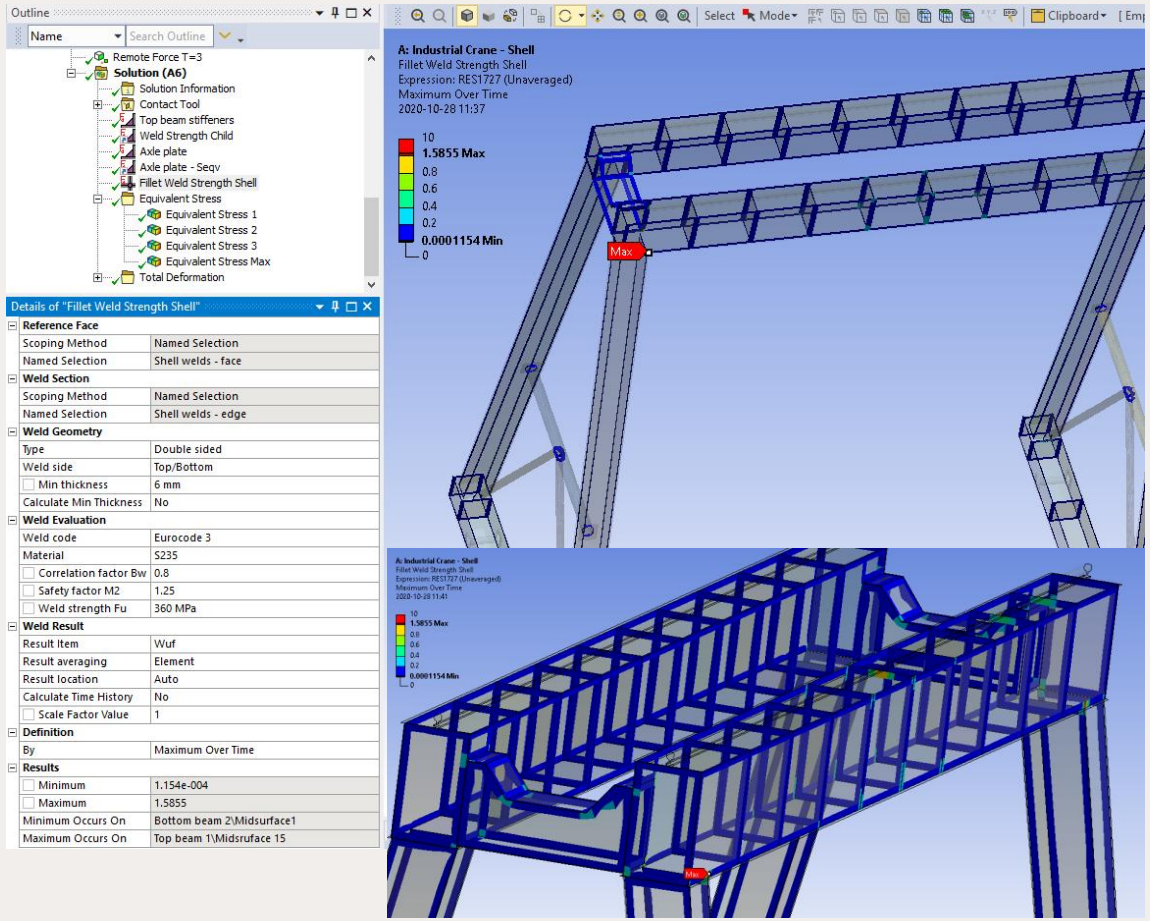






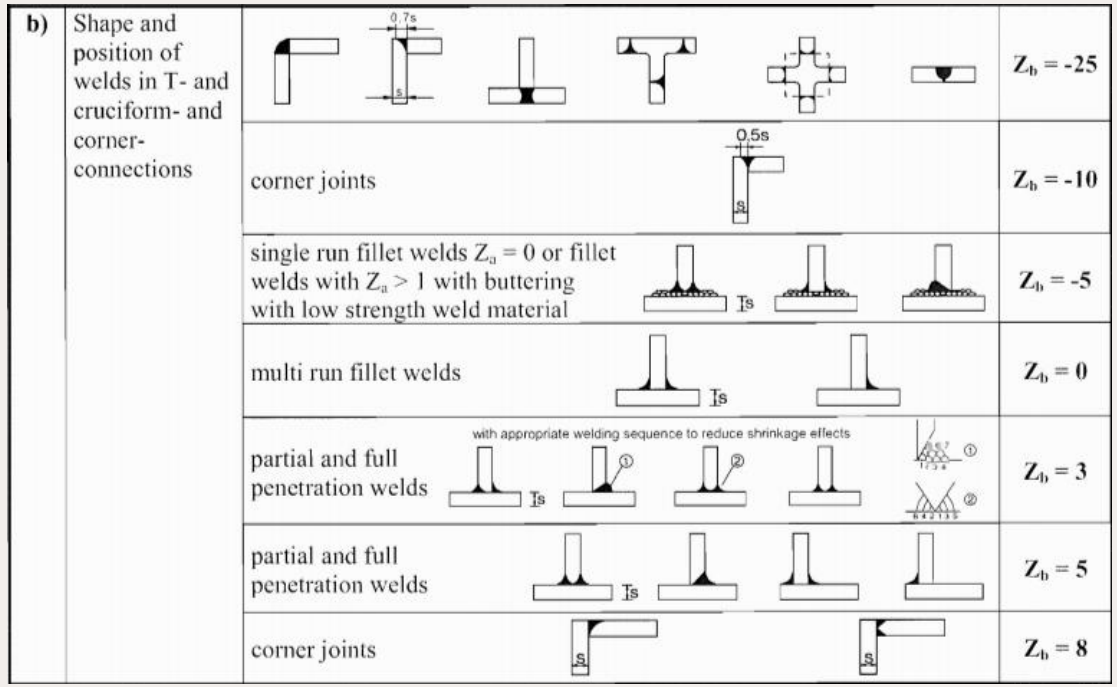
Weld Strength Shell

- *Weld Strength Shell* result can be used to evaluate large shell models with multiple cruciform joints.
- Result average can be “*Section*” or “*Element*”. (Element size is >> the weld throat size.)



Lamellar Strength

- The risk for lamellar tear can be evaluated according to Eurocode 3 with the “Lamellar Strength” result.
- Depending on the weld shape, weld position, boundary conditions and loading direction the required material quality can be evaluated.



b)	Shape and position of welds in T- and cruciform- and corner-connections	$Z_b = -25$
	corner joints	$Z_b = -10$
	single run fillet welds $Z_a = 0$ or fillet welds with $Z_a > 1$ with buttering with low strength weld material	$Z_b = -5$
	multi run fillet welds	$Z_b = 0$
	partial and full penetration welds	$Z_b = 3$
	partial and full penetration welds	$Z_b = 5$
	corner joints	$Z_b = 8$

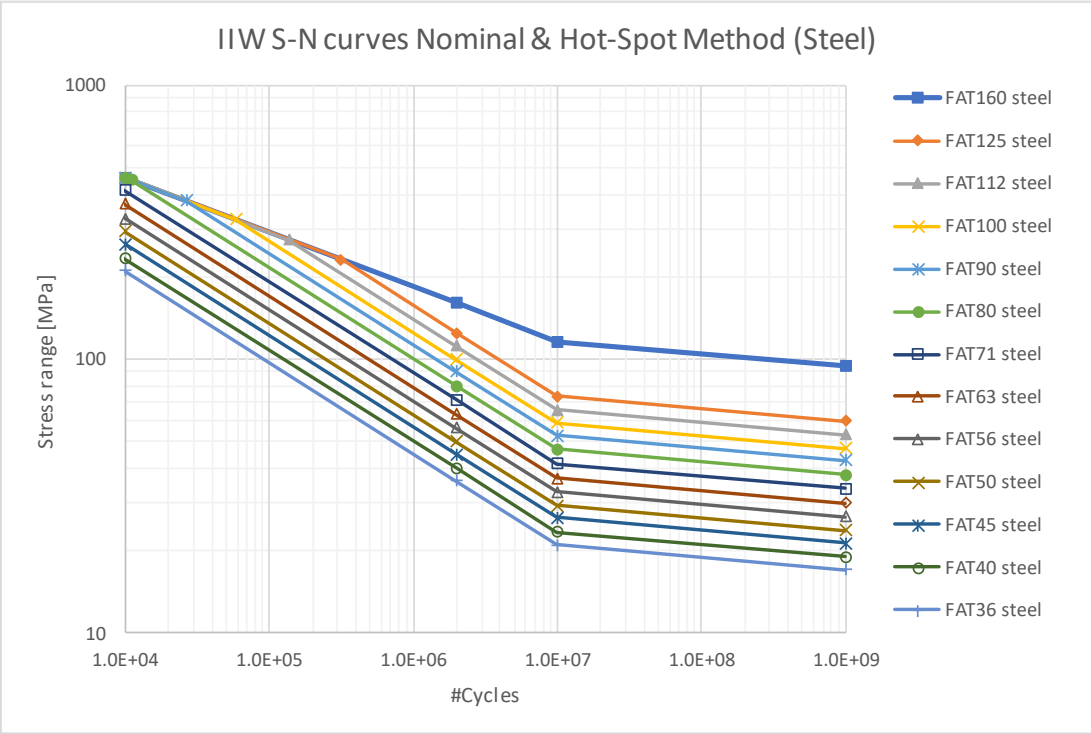
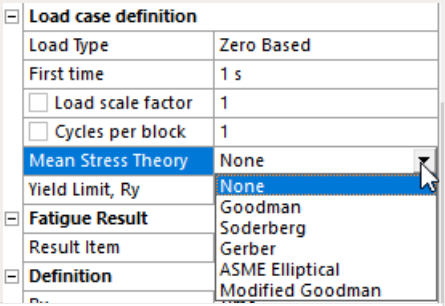
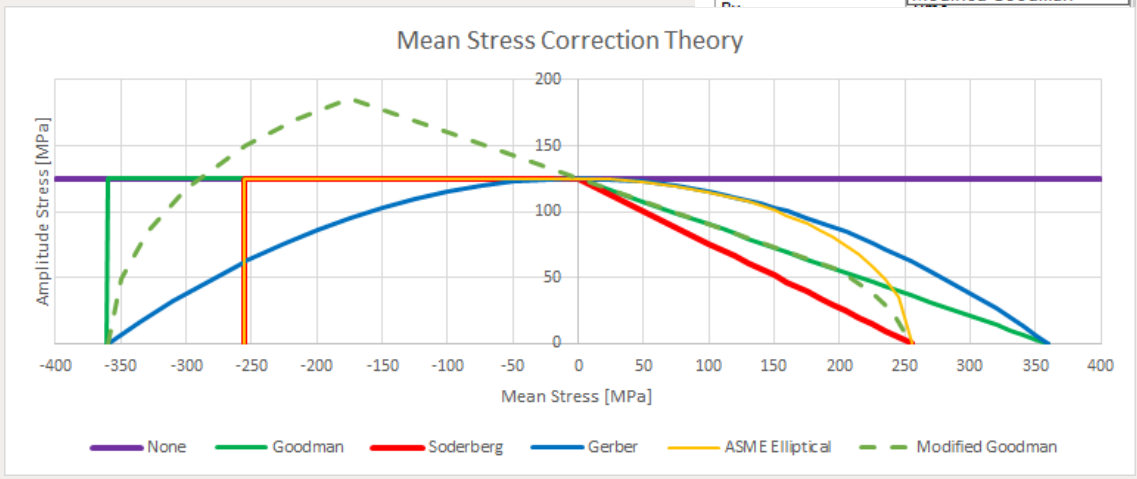
Fatigue S-N curves and MSC Theory

- The S-N curves are independent from Engineering Data and is applied for each fatigue result independent.
- User defined curves can be added in addition to the curves from IIW, Eurocode 3, Eurocode 9 and DNV.
- Mean Stress Correction can be applied in all fatigue methods.







Fatigue Load Case Definition

1. Zero Based
   Calculates a pulsating stress range (Loading Ratio = 0).
2. Fully Reversed
   Calculates an alternating stress range (Loading Ratio = -1).
3. Ratio (Loading Ratio)
   Calculates a stress range with custom Loading Ratio.
4. Load Combination
   Calculates the stress range between two selected steps.
5. Load Scanning
   Calculates the maximum stress range within the selected steps.
6. Solution Combination
   Calculates the stress range from summing the steps in Solution Editor.
7. Solution Scanning
   Calculates the maximum stress range within the steps in Solution Editor.
8. Random
   Calculates the damage using the “Steinberg formulation”

Linearized Fatigue

- Linearized Fatigue evaluates the linearized stress through the material thickness for all matching nodes of a selection between inside and outside of a solid part. This allows for efficient evaluation of e.g. nozzles and other pressure vessels according to ASME.
- All stress types (*Principal, Sum of Principal, Intensity, Equivalent, Normal, Shear*) and stress items (*Membrane, Bending, Membrane+Bending, Peak, Total*) can be used.

Membrane+Bending (Center)	112.2 MPa
Membrane+Bending (Outside)	-45.06 MPa

Structural Stress Fatigue

- Structural Stress fatigue uses the stress from a fillet weld strength result as input for life calculation. The weld stress is based on nodal forces in the weld section and both shell and solid models are supported.
- Stress type can be any of the weld section component stresses ($\sigma_{\perp}$, $\sigma_{//}$, $\tau_{\perp}$, $\tau_{//}$), derived stresses (σ_b, σ_s, σ_{tot}, τ_{tot}) or the equivalent stress defined in the selected weld code (σ_{eqv}).
  E.g. DNV Fatigue (2.3.4); $\sigma_{eqv} = \Delta\sigma_w = \mathrm{sqrt}(\Delta\sigma_{\perp}^2 + \Delta\tau_{\perp}^2 + 0.2*\Delta\tau_{//}^2)$

Nominal Fatigue

- Nominal fatigue is similar to Ansys fatigue module and evaluates the fatigue from surface stress of a part.
- Stresses type can be any of: *Principal, Sum of Principal, Intensity, Equivalent, Shear (Max), Normal X/Y/Z or Shear XY/YZ/XZ.*
- Stress singularities on boundary conditions can be excluded with a new option.

Hot-Spot Fatigue

- Hot-Spot Fatigue is a common method to extrapolate surface stress remote from a hot-spot location.
  It is a way to derive the Geometric stress at a weld toe and eliminate the stress singularities at the toe.
- Available stresses types: *Normal, Parallel, Shear, Shear (Max), Principal (no limit), Principal (IIW limit) , Principal (normal) , Principal (parallel), Equivalent, Equivalent (DNV).*
- Weld codes defines the location for extrapolation and corresponding fatigue class (FAT).
- It can be used with the “Add fillet weld” to automatically define the offset based on weld size.
- The “Weld” mesh control can create suitable mesh imprints for extrapolation locations on shell models.

Effective Notch Fatigue

- Effective Notch Fatigue is used to evaluate the weld toe or weld root fatigue using a detailed notch mesh (in a sub model). The notch is usually a 1 mm fillet and used together with a specific fatigue class (FAT).
- Available notch stress: *Tangential*, *Parallel, Principal, Sum of Prin., Stress Int., Equivalent or Shear (Max)*.
- The result from the notch is plotted on the notch edge (similar to Hot-Spot) and is excluding results on BC.

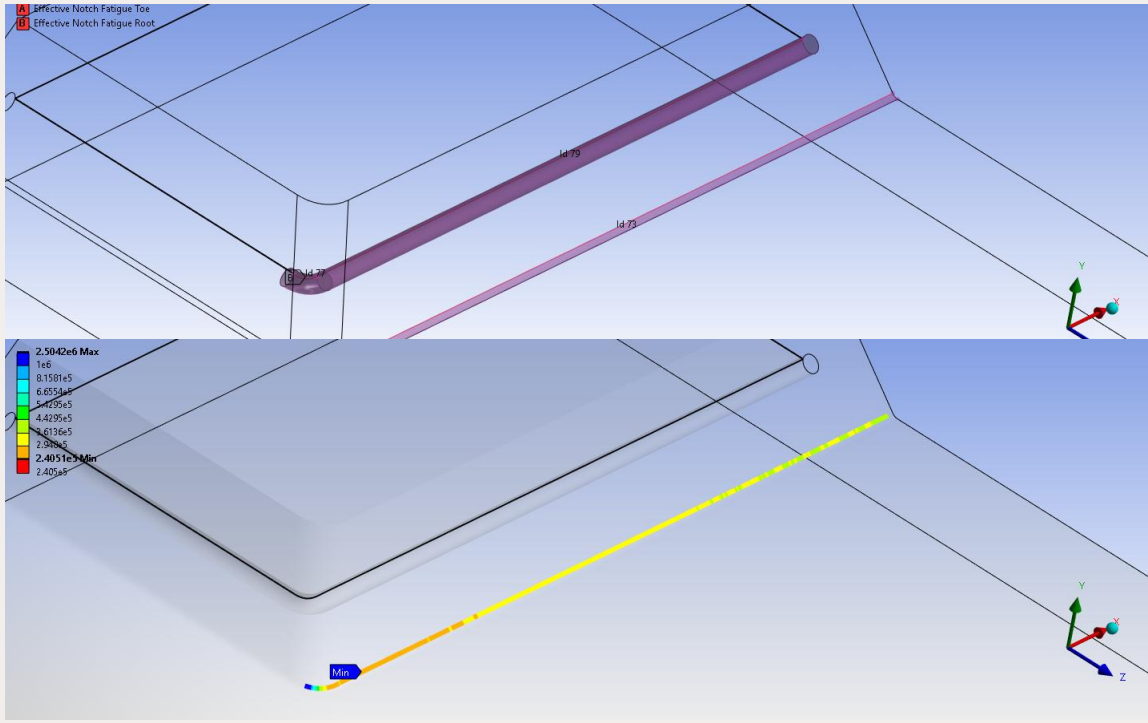
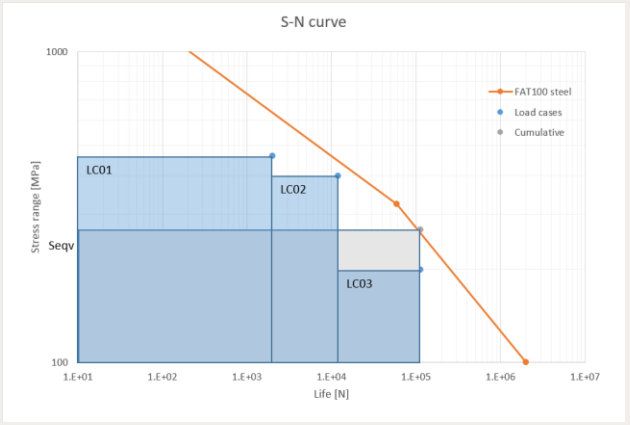
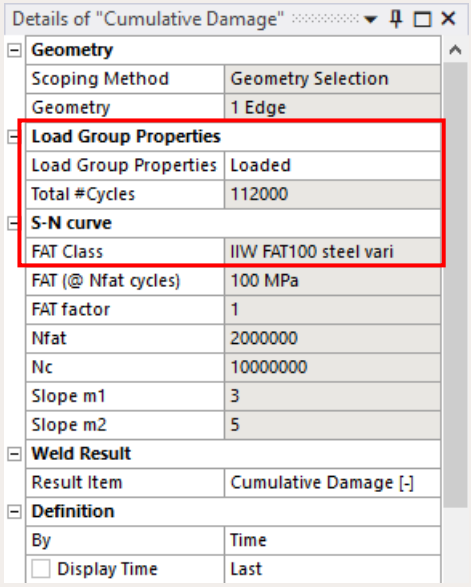
Fatigue Result	

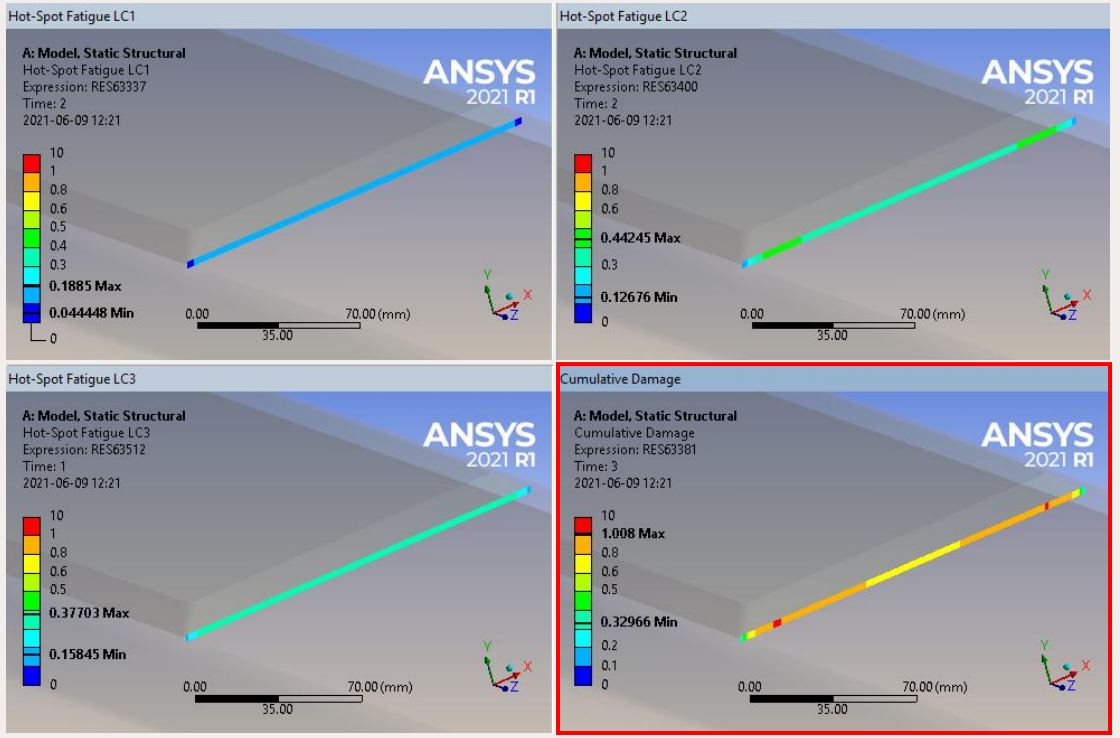


Cumulative Fatigue

- The total damage from a duty cycle can be evaluated using Cumulative Fatigue.
- Each individual event (load case with number of cycles) is defined using one of the available methods and then grouped in the model tree together with the Cumulative fatigue result object.

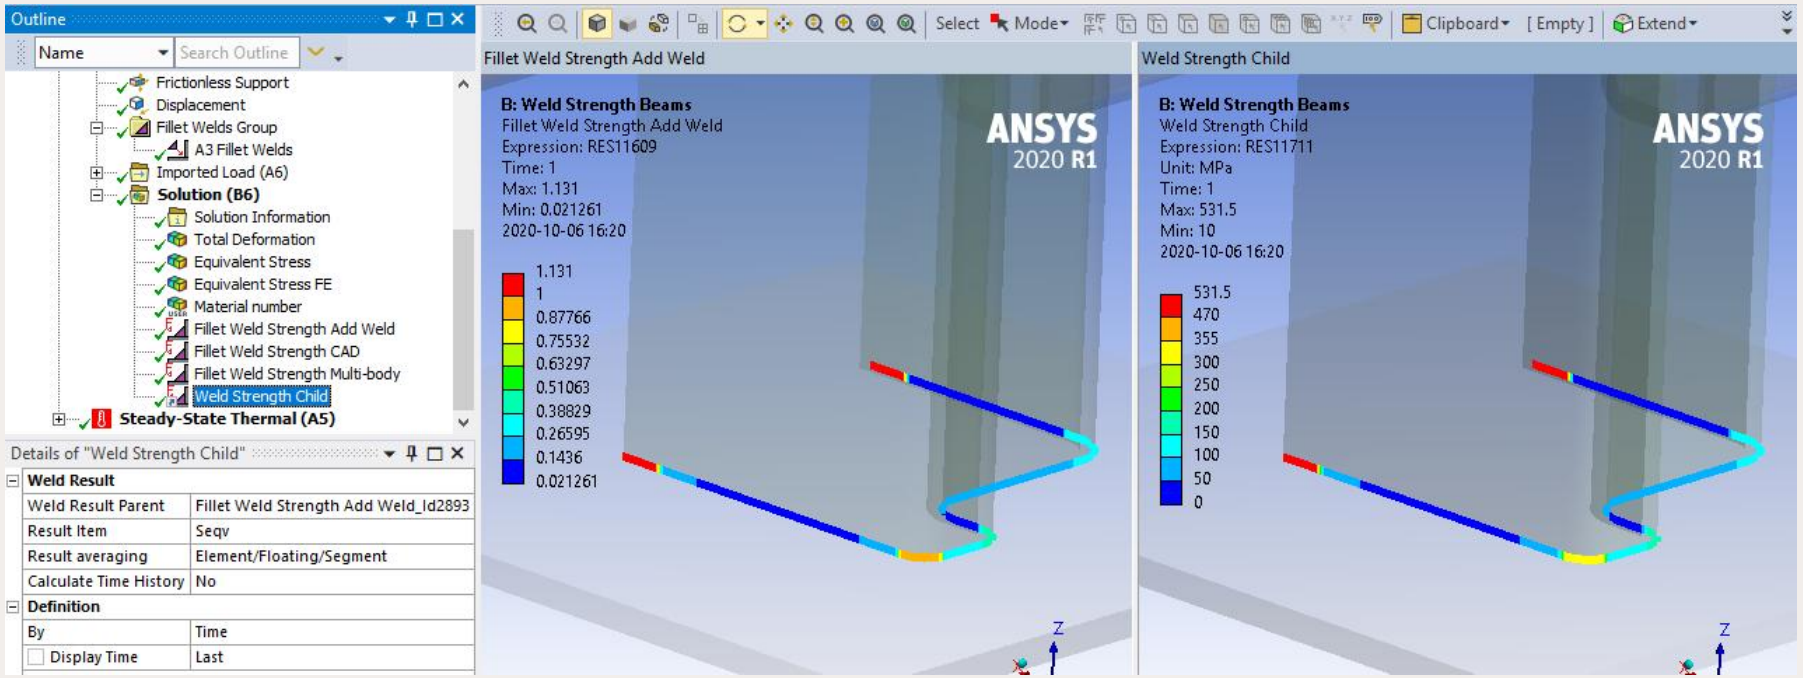






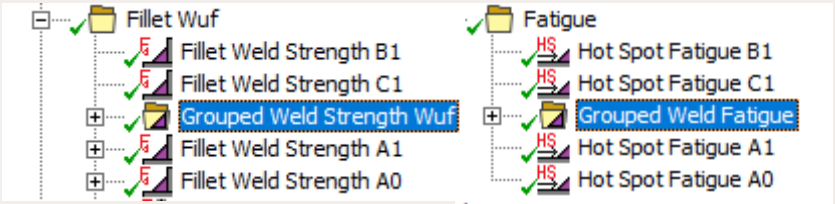
Child Result

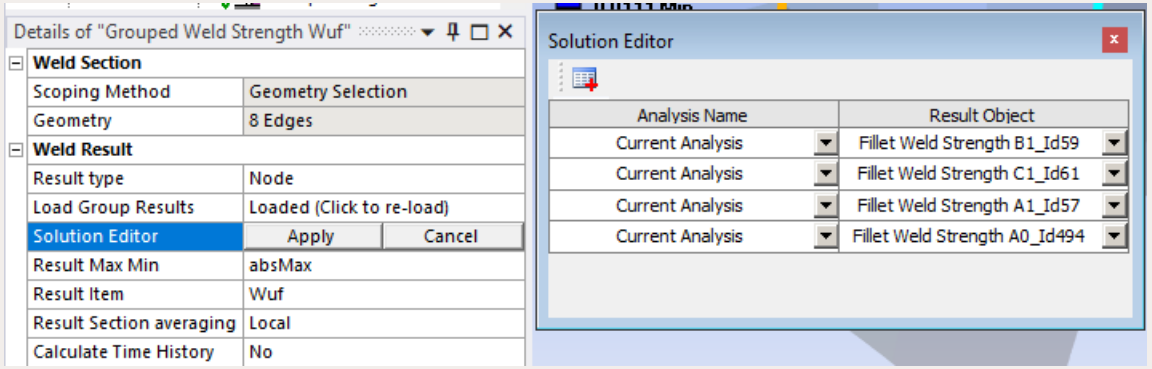
- The Weld Child Result let you select a parent result and plot a different result item (and/or time/set number) while keeping all other settings the same as in the parent result.
- This result object does not output any summary tables to the bolt report since they are listed for the parent result object. When clearing and edit the parent the children are updated as well.

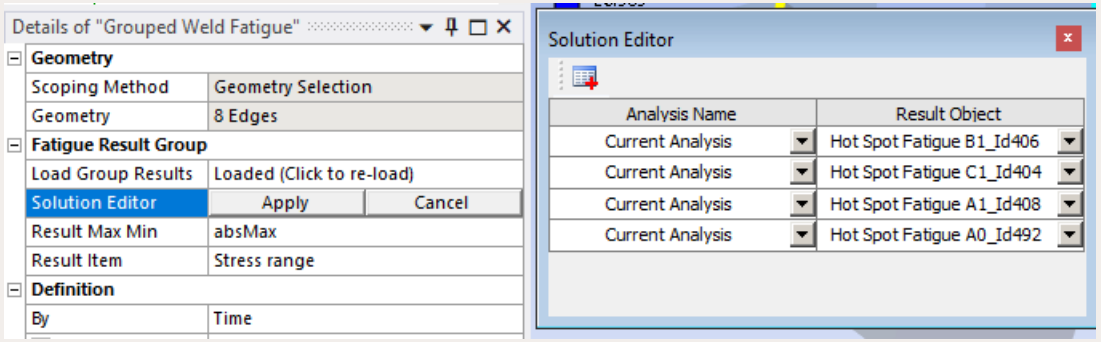


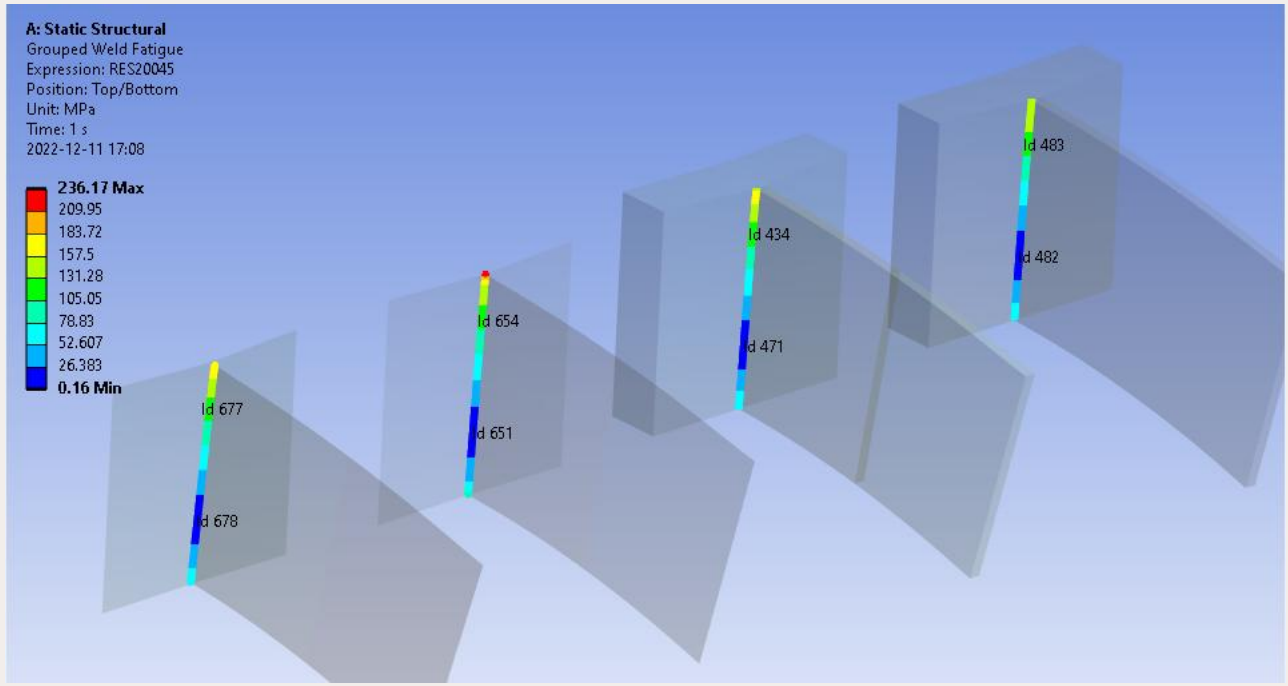
Grouped Result

- *Grouped Weld Strength/Fatigue* result combine many results within the same group in the model tree or from selected results from different analysis using the Solution Editor into one plot.
- The results *absMax*, *Max* or *Min* results can be evaluated to see the overall max from several load cases.









Worksheet Preview

- The “Worksheet Preview” is a feature in the *Report Generator* app that displays all details of a weld object including the result summary tables in the “Worksheet” window. (Report Generator license is not needed.)
- This feature is useful to look at the design values and different result items in the summary tables.

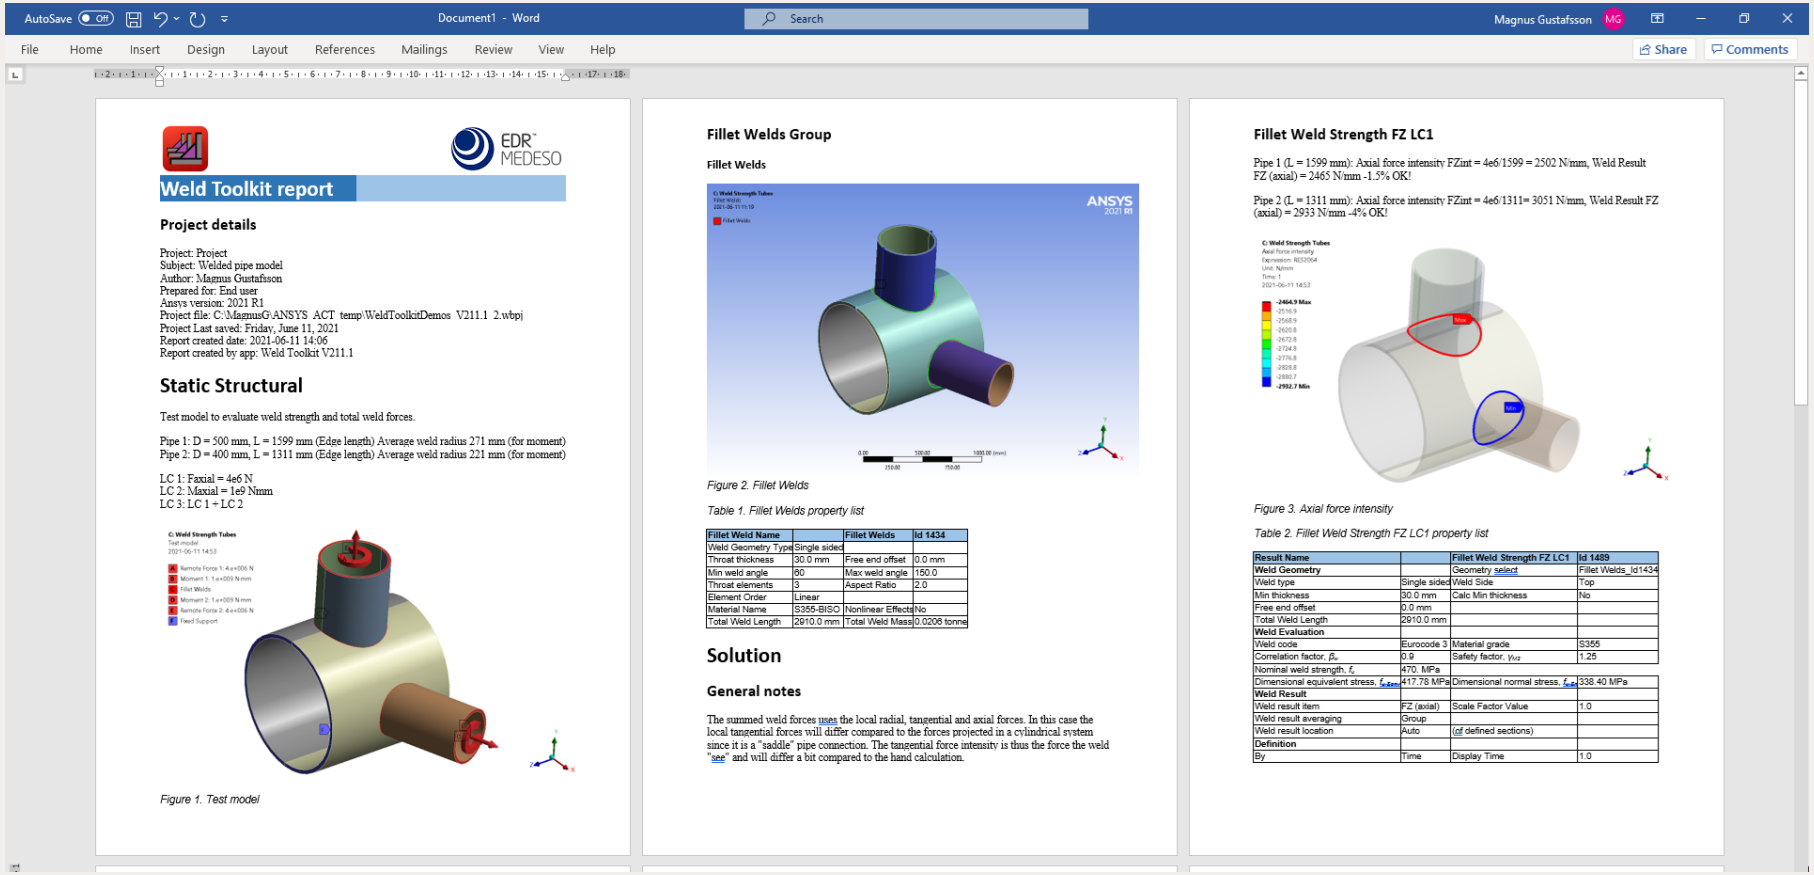
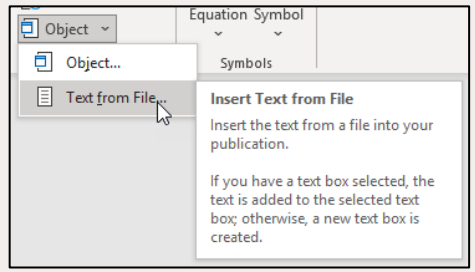
Weld Report

- A HTML formatted report of all welds and weld results including any comments, figures and images is created with a click on “Weld Report ” using the Report Generator app. (Report Generator license is not needed.)
- The report can be imported to Microsoft Word (Insert>Text from File…).





User defined Weld codes & S-N Curves

- Weld Settings control panel to edit default values for add welds, strength and fatigue results.
- User define weld strength codes and material grades can be added in addition to Eurocode 3 and AWS.
- User defined weld fatigue S-N curves (FAT class) can be added in addition to IIW, Eurocode 3/9 and DNV.

EDRMedeso licensing features

- Starting in 2025 the EDRMedeso apps uses a cloud license server connecting via internet HTTPS protocol (over the standard TCP port 443) to activate and check out/in the license.
- The cloud license server eliminates the need for running a local license server or to manage specific network/firewall settings. Any Windows PC (physical or virtual) can connect.
- When using an app feature in pre or post processing the app license is checked out and the “Active License” button turns green. You may release the app license from the current PC by clicking the “Active License” button that then turns grey indicating that the license is free.
- If the license is not available a warning message is displayed in Mechanical.
- The app license is installed using the “Install License File” and the license status and current users is listed using the “Check License Status”.
